Delivery & Fulfilment Standard

Version 1.0 | FINAL / LOCKED | September 2026

Morning Box - Your Personal Breakfast Assistant

Purpose

This standard defines the MVP delivery and fulfilment model for Morning Box, from next-day order cutoff and bakery preparation through routing, handover, delivery, proof of delivery, exceptions and refunds.

Core Operating Principle

> **Scheduled breakfast delivery, designed around freshness, reliability and minimum customer effort.**

1. Delivery Model

Morning Box is a scheduled breakfast delivery service, not an on-demand delivery service. Orders are known in advance so bakery production and delivery routes can be planned before the morning operation begins.

The MVP model is Scheduled Delivery + Route Consolidation where practical + Door/Reception Delivery. Customers select a delivery window; Morning Box and its delivery partner manage the exact route and delivery time inside that window.

> **The customer chooses a delivery window. Morning Box manages the route.**

2. Order Cutoff Time

The fixed next-day cutoff is 9:00 PM on the previous day. Before cutoff, a customer may place, edit, add to or cancel an affected next-day breakfast. After cutoff, the next-day order is closed for normal customer changes because production and routing planning begins.

This rule applies to Personal and Business orders unless a future large-order policy explicitly requires a longer lead time.

> **Order by 9:00 PM for next-day breakfast.**

3. Delivery Windows

The MVP delivery windows are:
7:30-8:30 AM
8:30-9:30 AM
9:30-10:30 AM

Morning Box commits to the selected window rather than an exact minute of arrival. One-hour windows provide useful customer predictability while preserving practical route consolidation.

> **Morning Box promises a delivery window, not an exact delivery time.**

4. Bakery Preparation & Handover

After the 9:00 PM cutoff, each allocated Partner Bakery receives the confirmed production requirements for the next morning, including Breakfast Model, Size, approved Swaps/Add-ons, quantities and relevant Dietary/Allergy requirements. Unnecessary customer information should not be shared.

Breakfast is prepared fresh for the scheduled morning according to Morning Box standards. Partner Bakery bread must be baked in-house. Packaging remains bakery-branded with Morning Box identification, and every order/box must have a clear Order ID. Special/Allergy-related boxes require unmistakable identification.

Rather than one fixed pickup time, Morning Box assigns a Ready By time based on Delivery Window, route and travel time. Handover is confirmed through operational statuses such as Prepared, Ready, Picked Up, Out for Delivery and Delivered.

> **The bakery prepares. Morning Box coordinates. The delivery partner delivers.**

5. Delivery Tracking & Customer Communication

Customer-facing tracking remains intentionally simple: Order Confirmed -> Being Prepared -> Out for Delivery -> Delivered. More detailed statuses may exist in the backend without adding complexity to the customer experience.

Core notifications are sent after confirmation, when the breakfast is on the way, and after delivery. Following delivery, Morning Box may request the locked simple feedback: Loved it / Not for me.

For office and business delivery, the system should record the receiving point where possible, for example: Delivered to Reception - 8:14 AM.

Keep the customer informed without making them track the delivery.

6. Late Delivery, Failed Delivery & Operational Exceptions

If an order is expected to miss its promised window, the customer should be informed before the window ends where reasonably possible. If an allocated bakery cannot fulfil the order, Morning Box first checks whether another eligible Partner Bakery can fulfil it without compromising product, safety or timing requirements.

If delivery cannot be completed because the receiving point is unavailable or the contact cannot be reached, a delivery attempt must be recorded before the order is marked failed.

Morning Box owns service recovery from the customer's perspective. The customer should not be passed between the bakery and courier. Exact service credits or compensation levels are deferred until operating economics and pilot data are available.

Morning Box owns the customer experience, even when a partner causes the problem.

7. Bakery Allocation & Delivery Routing

Before allocation, bakeries are filtered for Product Availability, Dietary/Allergy Capability, Capacity and Delivery Window. Among eligible partners, Morning Box applies the locked proximity-first model and selects the nearest suitable bakery.

Orders may be consolidated into a route when pickup points, destinations and delivery windows are compatible. Consolidation is allowed only when service quality is protected.

For large Business orders, Morning Box uses Single Bakery First. If capacity requires expansion, the system may allocate remaining quantity to the next nearest eligible partner. Any split remains a backend operation; the customer retains one order and one payment.

Eligibility -> On-Time Delivery & Freshness -> Efficient Routing.

8. Delivery Capacity & Order Limits

A delivery window remains available only while both production capacity and delivery capacity are available. If either is exhausted, the affected window becomes unavailable for new orders.

Business order capacity must be validated before payment. Morning Box should not accept payment for an order it cannot reasonably fulfil. No fixed maximum headcount is set in v1.0; practical limits will be based on actual bakery and delivery capacity.

Capacity should control availability before checkout - not create problems after payment.

9. Freshness & Delivery Quality Standard

Delivery quality is not measured by punctuality alone. Breakfast should be prepared for the scheduled morning, transported in packaging suitable for the product, and protected from crushing, leakage, tipping or unsuitable transport conditions.

The elapsed time across Ready -> Pickup -> Delivered should be kept as short as practical. Route consolidation must not create material deterioration in breakfast quality.

Exact maximum holding or transport times are intentionally not fixed until DIFC pilot data and product-specific operating requirements are available.

> **Freshness takes priority over delivery efficiency.**

10. Proof of Delivery & Responsibility

A Personal order is delivered when it is handed to the customer, an authorized Reception/Concierge, or another receiving person explicitly designated by the customer. A Business order is delivered when handed to the Contact Person, Reception or another authorized receiving point.

Minimum proof of delivery should capture Delivery Time + Delivery Location/Point + Recipient Type. A complex signature process is not required for MVP. Photo proof may be used operationally where supported, without requiring a photograph of the customer.

Morning Box remains responsible until successful handover to the customer or an authorized receiving point.

> **Arrival is not delivery. Handover is delivery.**

11. Cancellation, Refund & Delivery Failure Rules

Before the 9:00 PM cutoff, an affected next-day breakfast may be edited or cancelled. Customer cancellation before cutoff receives a Full Refund for that breakfast. In a Multi-Day order, cancelling one date does not cancel the remaining dates.

After cutoff, normal customer cancellation is not eligible for a full refund because production and delivery planning have begun.

If Morning Box cannot fulfil a paid breakfast because of bakery, delivery or other Morning Box operational failure, the affected breakfast receives a Full Refund. A late delivery outside the promised window is recorded as a service failure; the exact refund/credit threshold and compensation amount will be determined after pilot data is available.

> **If Morning Box cannot fulfil a paid breakfast, the customer should not carry the financial loss.**

MVP Deferred Operational Details

The following are intentionally deferred rather than guessed: large-business-order lead times, exact service-credit thresholds, exact route/holding-time KPIs, product-specific transport requirements, and final delivery-partner operating procedures. These should be finalized from partner capability and DIFC pilot data.
