MB-OPS-001

Morning Box Operations Standard

Version 1.0 | FINAL / LOCKED | September 2026

Morning Box - Your Personal Breakfast Assistant

Purpose

This standard defines the end-to-end daily operating model for Morning Box, from the previous-night order cutoff through bakery allocation, production, courier handover, delivery, exception management, reconciliation and daily performance review.

Operating Principle

> **Automate the normal. Surface the exception. Keep Morning Box in control.**

1. Daily Operational Cycle

Morning Box operates a repeatable night-before and morning cycle. Orders for next-day breakfast remain open until the locked 9:00 PM cutoff. At cutoff, next-day orders are frozen for normal new orders, edits and cancellations.

Night-before operations follow: Finalize Orders -> Validate Capacity -> Final Bakery Allocation -> Generate Production Lists -> Bakery Confirmation -> Finalize Delivery Routes. The objective is to resolve foreseeable issues before morning production begins.

Morning operations follow each Batch's Ready-by Time: In Preparation -> Quality Check -> Ready -> Courier Pickup -> Handed Over -> Out for Delivery -> Delivered. After delivery, Morning Box closes deliveries, records exceptions, captures feedback and performs operational reconciliation.

Partner bakeries do not require one universal kitchen start time. Each bakery organizes its own production around assigned Ready-by Times.

> **Plan the night before. Execute by exception in the morning.**

2. Order Finalization & Bakery Allocation

At 9:00 PM, Morning Box performs final validation of next-day orders. An order entering production must have confirmed payment, valid product and size, valid dietary/allergy requirements, a valid delivery location and a valid delivery window.

Bakery eligibility is filtered through Product Capability -> Dietary/Allergy Capability -> Capacity -> Delivery Window, followed by the MVP allocation rule: Nearest Eligible Partner Bakery.

Capacity should be reserved when the customer confirms and pays. This allows a Provisional Allocation during ordering, followed by Final Allocation at cutoff. This protects Morning Box against accepting demand that cannot reasonably be fulfilled.

For Business orders: Single Bakery First -> Nearest Eligible Bakery Expansion when required. Any order that cannot be allocated enters an Exception Queue and must not remain without operational ownership.

> **Reserve capacity when the customer orders. Finalize allocation at cutoff.**

3. Production List Generation

After Final Allocation, each Partner Bakery receives a simple actionable Production Plan. It begins with a daily summary such as total breakfasts and earliest Ready-by Time, then organizes production by Ready-by Time or operational Batch.

Morning Box separates two operational views. The Production View aggregates what the kitchen needs to produce by Breakfast Model, Size and Quantity, while clearly identifying relevant Swaps, Add-ons and Special requirements. The Packing View identifies exactly what belongs to each Order or Box for assembly and handover.

Allergy and Special Breakfast requirements must be clearly identifiable in both relevant views. Only customer information required for production, safety and handover should be shared with the bakery.

> **Aggregate for production. Separate for packing. Identify every order for handover.**

4. Bakery Confirmation & Exception Handling

After receiving the final Production Plan, the bakery must explicitly Confirm Production Plan or Report an Issue. Standard issue reasons include Product/Ingredient Unavailable, Capacity Issue, Dietary/Allergy Issue, Equipment/Operational Issue and Other.

A bakery must not confirm a plan and then silently change an order during production. Reported issues enter the Morning Box Exception Queue. Morning Box may reallocate to the Next Eligible Bakery and update production and routing, or, where fulfilment is not feasible, initiate customer communication and the appropriate refund/service-recovery process.

An exact confirmation-response deadline is deferred until pilot operations establish realistic partner staffing and response patterns, but every production plan must be confirmed before morning production begins.

> **No confirmed production plan should enter the morning without an accountable bakery.**

5. Morning Production Monitoring

Morning Box monitors whether production is progressing toward Ready-by Time without attempting to manage the Partner Bakery's internal kitchen workflow. The bakery-facing production states are intentionally simple: Confirmed -> In Preparation -> Ready, with Report Delay available when needed.

In Preparation may be managed at Batch level rather than requiring every individual Box to be updated. An order or Batch is marked Ready only when it is prepared, quality checked, packed and labelled for courier handover.

The Morning Box Operations Dashboard should emphasize On Track, Attention Required and Late so operational staff can focus on exceptions instead of manually supervising every successful order.

> **Morning Box monitors readiness, not the bakery's kitchen.**

6. Courier Coordination & Pickup

Courier assignment is planned before food becomes Ready, using Bakery, Ready-by Time, Delivery Window, Delivery Area and Route Capacity. Pickup planning should synchronize the courier's arrival with the bakery's expected readiness to minimize both food waiting time and driver waiting time.

At pickup, the courier verifies the Batch/Order identification, number of boxes and identification of Special Breakfasts. The courier does not open boxes to inspect food contents; content accuracy remains part of bakery quality control.

After physical handover, the bakery records Handed Over and delivery records Picked Up. Pickup Delay and Courier Delay are recorded separately so performance responsibility remains measurable.

Compatible orders may be route-consolidated only where Delivery Window, travel time and Freshness remain protected.

> **Synchronize preparation and pickup - minimize waiting on both sides. Freshness takes priority over delivery efficiency.**

7. Handover & Dispatch Control

Before dispatch, the bakery performs a final handover check against Batch/Order ID, number of boxes, Add-ons, Special Boxes, packaging and labels. For larger Business orders, the handover record must preserve the breakdown of General and Special Boxes rather than recording only a total quantity.

A successful handover creates a record including Order/Batch ID, number of boxes, pickup time and Courier/Route ID. If physical quantity or identification does not match the digital pickup record, the order must not be dispatched until the discrepancy is resolved.

After successful handover, the delivery state advances from Picked Up -> Out for Delivery. Customer-facing communication may then state that the Morning Box is on the way.

Before handover the Partner Bakery holds physical responsibility; after handover the Delivery Partner holds physical last-mile responsibility; Morning Box retains end-to-end responsibility for the customer experience.

> **Nothing leaves the bakery unless the physical handover matches the digital order record.**

8. Live Morning Operations & Exception Management

Normal orders should progress without manual intervention. The live dashboard focuses attention on On Track, Attention Required and Service Risk/Failed.

MVP exception categories include Bakery Exceptions, Courier Exceptions, Customer/Location Exceptions and Safety Exceptions. Safety-related concerns receive the highest operational priority. Every exception must have an Owner, Action and Resolution; reporting a problem without operational ownership is insufficient.

Resolution actions may include bakery reallocation, pickup or route adjustment, delivery-partner contact, customer contact, cancellation, refund or service recovery. Partner bakeries and couriers do not independently determine customer-facing remedies.

Customers are informed when an operational problem materially affects their order, rather than receiving unnecessary internal status messages. In a Multi-Day order, an exception affects only the relevant day unless another day is independently impacted.

Significant incidents are recorded with Cause, Responsible Party, Action Taken and Outcome for later performance analysis.

> **Normal orders flow automatically. Human attention goes to exceptions. Morning Box owns the resolution, even when another partner caused the problem.**

9. Order Completion & Daily Reconciliation

An order becomes Completed only after a valid delivery and Proof of Delivery are recorded. The existing fulfilment rule remains: Arrival is not delivery. Handover is delivery.

Morning Box automatically reconciles Customer Order <-> Bakery Fulfilment <-> Delivery Record. Where these records match, the order is Automatically Reconciled. Only mismatches enter a Reconciliation Exception queue.

Each order retains the financial records required for later settlement and accounting, including Customer Payment, Discounts/Refunds, Bakery Payable, Delivery Cost and Morning Box Revenue/Margin. The exact settlement cycle is defined separately in the Commercial Standard.

Failed, late, refunded and partner-caused exception orders remain identifiable rather than disappearing into successful-order totals. A simple daily operations summary shows delivery, lateness, failure, refunds and major exception counts.

> **Match the order, fulfilment and delivery records automatically. Investigate only the exceptions.**

10. Customer Issue & Service Recovery

After delivery, the customer can provide simple feedback and, where necessary, use Report an Issue. MVP issue categories include Missing/Incorrect Item, Quality Issue, Packaging Issue, Late Delivery, Dietary/Allergy Concern, Order Not Received and Other. A short explanation or photo may be accepted when useful, but a photo is not mandatory for submitting a complaint.

The customer reports the problem to Morning Box, not separately to the bakery or courier. Morning Box investigates responsibility internally and may apply No Financial Action, Credit, Partial Refund or Full Refund depending on the issue and future service-recovery policy. Exact compensation thresholds are deferred until pilot data is available.

The already-locked rule remains: if Morning Box cannot fulfil a paid breakfast, the affected breakfast receives a Full Refund.

Dietary/Allergy concerns are escalated as High-Priority Safety Incidents and may trigger partner review or suspension under MB-BKY-001. Complaint data feeds operational and partner-performance records.

> **Make it easy for the customer to report a problem. Keep the complexity behind Morning Box. Resolve the customer's problem first. Determine partner responsibility internally.**

11. Daily Performance Review & Continuous Improvement

At the end of morning operations, Morning Box generates a concise Daily Operational Snapshot covering Orders Received, Orders Delivered, On-Time, Late, Failed, Refunded and Exceptions, with useful separation of Bakery, Delivery, Customer and Safety issues.

Operational data updates Partner Performance records. Bakery performance may include Order Accuracy, Ready-on-Time, Quality and Fulfilment Reliability; delivery performance may include Pickup Performance, On-Time Delivery, Failed Delivery and delivery-related complaints.

Routine successful orders do not require manual review. Morning Box reviews Exceptions, unusual patterns and unresolved cases. Repeated problems follow Identify Pattern -> Determine Cause -> Corrective Action -> Monitor Result and may connect to the Partner Status process in MB-BKY-001.

Operational records may later improve allocation, Ready-by Times, route planning, capacity limits and availability. MVP does not require complex predictive AI. Each order should remain one coherent operational record from Order through Allocation, Production, Handover, Delivery, Issue if any, Financial Reconciliation and Completion.

> **Measure what happened. Fix what failed. Improve what repeats.**

Deferred Operational Parameters

Exact bakery confirmation response times, detailed service-recovery compensation thresholds, settlement cycles, detailed production temperatures/holding rules and advanced predictive operational logic are intentionally deferred until pilot data and the related production, food-safety and commercial standards are completed.
