MORNING BOX

Your Personal Breakfast Assistant

MB-PER-001

Personalization & Morning Profile Standard

Version 1.0 | FINAL / LOCKED | September 2026

Purpose

This standard defines how Morning Box understands a personal user, adapts to different mornings, supports advance weekly planning, and progressively learns from user behavior. It intentionally excludes detailed product composition, pricing, ordering mechanics and delivery cut-off rules.

Core Architecture

Base Morning Profile → Daily Context → Weekly Morning Plan → Learned Behavior

One user. One profile. Different mornings.

1. Base Morning Profile

The Base Morning Profile contains only information that is useful across multiple mornings. It must remain short, simple and editable. Price, portion, size, quantity and product customization are not profile questions.

Q1 - Eating Style

How do you usually like to eat?

Health-Conscious - I usually prefer wholesome, balanced and less processed foods.
Flexible - I enjoy a wider variety of foods and don't specifically limit myself to health-focused choices.

Eating Style describes how the user prefers to eat. It is not a medical classification or permanent restriction.

Q2 - Breakfast Preference

What kind of breakfast do you usually enjoy?

Savory Breakfast / Bakery & Pastry / Fresh & Wholesome / Sweet Breakfast

This is multi-select. The user may select as many preference categories as desired. Breakfast Preference describes what the user enjoys; Eating Style shapes the appropriate version of that preference.

Q3 - Dietary Requirements & Allergies

Do you have any dietary requirements or allergies?

One simple screen should contain two clearly separated areas: Dietary Requirements and Allergies. Both support multiple selections and remain editable.

> **Safety restrictions always override preferences.**

Profile Exclusions

Preferred price, portion need, product size, quantity, additions/removals and product composition are intentionally handled during the ordering experience rather than stored as mandatory Base Profile questions.

2. Daily Morning Context

A user's morning can change from day to day. For each planned day, Morning Box can use one of four simple contexts to understand that morning:

Context	Purpose
Active Morning	A more active or physically demanding morning.
Regular Workday	A typical workday morning.
Busy & On the Go	A time-sensitive morning where convenience matters strongly.
Relaxed Morning	A less rushed morning with greater flexibility.

Only ask a context question when it can meaningfully affect the recommendation. Users should not be asked to predict future hunger or answer questions they cannot reasonably know in advance.

3. Weekly Morning Plan

After the profile, the user enters a weekly planning space. Morning Box supports advance breakfast planning beginning with the next available day. The user may plan one day, several days, or all available days in a week.

Each day remains an independent planned breakfast. A user may have a different Daily Context, breakfast selection and order configuration on different days.

> **This is pre-order planning, not on-demand ordering.**

3.1 Copy Previous Day

After a day is planned, the user may use Same as Previous Day for the next day or choose Choose a Different Morning. A copied day becomes independent and remains editable without changing the original day.

3.2 Reuse a Weekly Plan

A completed weekly plan can be reused for a future week through a deliberate action such as Use This Plan Again. The user may copy the same week to the next week or another future week and then edit individual days as needed.

A copied week does not create an automatic subscription or recurring order. The user intentionally selects, reviews and confirms the future plan.

3.3 Future Weeks

The same weekly-planning logic applies beyond the immediate next week. Users can prepare future weeks in advance, subject to operational availability and delivery rules defined elsewhere.

4. Learned Behavior

Morning Box should become easier to use over time. The system may learn from explicit user behavior such as confirmed orders, selected alternatives, product changes, size or composition changes, repeated weekly patterns and simple feedback.

> **Ask less. Learn more.**
>
> **The more you use Morning Box, the less you should need to think about breakfast.**

Learning should improve recommendations and reduce repetitive decisions; it must not silently create automatic orders.

5. Personalization Logic

At a conceptual level, the daily recommendation is informed by the user's Base Morning Profile, that day's Daily Context, relevant safety restrictions, and learned behavior. Product-level choices and pricing are applied later in the ordering flow.

> **Understand the Person → Understand the Morning → Recommend the Breakfast → Learn from Behavior → Improve the Next Recommendation**

6. Boundaries & Deferred Decisions

The following are intentionally outside this standard: exact breakfast products, sizes, ingredient customization rules, quantity logic, pricing, payment, delivery method, and the exact order/edit/cancellation cut-off. These will be defined in the relevant Product, Flow and Delivery standards.

7. Locked Principles

- Keep onboarding to three Base Profile questions.
- Questions stay consistent; answers stay editable.
- Safety restrictions override preferences.

- Different days may have different morning contexts.
- Users may plan one day, multiple days or future weeks.
- Previous days and complete weeks may be copied, then independently edited.
- Weekly reuse is not an automatic subscription or recurring order.
- Morning Box should reduce repeated decisions as it learns.
